HAMMER

WINCH

WHO ARE WE?

Hammer Industry, founded in 1982 in a modest workshop in Ankara under the name Altınçekiç, continues its efforts to become a world brand in the winch industry today.

Our company, which has adopted the principle of producing technology and being among the best in its sector since its establishment, developed the hydraulic winch for the first time in the country and made it ready for production in 2003, and started mass production of winches under the brand of Hammer Winch.

Hammer Winch's production facility is the largest industrial complex in its sector, exports hydraulic winches to many countries on 7 continents by attaining success in the global markets after it had success within Turkey, thanks to its world-class production mentality and innovative vision.

Hammer Winch constantly improves the effectiveness of its Quality Management System, and its products, tested under the toughest conditions, are chosen mainly for civilian use in addition to many strategic and military projects.

With its wide technological infrastructure, it aims to add value to its brand in this field by making use of domestic and foreign resources and using all the possibilities of modern technology.

Hammer Winch will always continue to offer the best quality with its expert staff consisting of experienced personnel in the sector and its reliable image.

MISSION - VISION

To meet the needs and expectations of the sector at a high level, to enter the international competition by producing hydraulic winch technologies, and to offer high standard products with the best quality to our customers all over the world.

To make HAMMER WINCH a world brand with an innovative, sustainable, high quality production approach.

Since
2003

HAMMER WINCH

Quality.
Strength.
Durability.

R&D and P&D

As a brand that leads the sector, Hammer Winch manages the product development processes with its own R&D Center.

It expands its R&D and P&D studies with its understanding that attaches importance to innovation, and thus, in the products it develops; It constantly improves qualities such as technology, weight, design, ease of assembly and durability.

Existing Product Improvement

Apart from our own R&D and P&D activities, our company also takes into account the feedback from our customers regarding the use and performance of the products, analyze the notifications made in order to increase the performance of the existing products and to provide added value, to eliminate the detected problems and research to improve the existing products, carries out development and design work.

New Product Development

In our company, new product targets to be added to the product portfolio next year are determined by taking the Global Market Research studies as a reference, and research, development and design studies are planned and carried out in this direction.

The R&D center carries out its studies on choosing the right material and making the most suitable design for the desired performance.

After our R&D studies, designs are optimized with simulation and strength analysis with proven programs in the field.

Prototype production of the new product, which passes the analysis successfully, is carried out.

The prototype product is subjected to maximum load capacities and life tests in test units specially produced for winches in our test center. Static and dynamic load tests are performed according to the relevant standards for each product produced in the test units.

The mass production of the product, which is approved as a result of the load tests, is started.

PRODUCTS

Hammer Winch, which makes mass production of products covering EN 14492-1 and SAE J706 standards from 3 tons to 50 tons, as well as its wide product range, can also design, develop and produce specific products to the customer and project in line with the requests and demands of its customers.

Hammer Winch can offer optional features such as operating in -32 and +50 degrees celsius environmental conditions, with 1000 hours of corrosion resistance, in IP 67 - IP 68 standards and double speed winch in some product groups in special projects and the demands of its customers.

MATERIAL SELECTION

Our reels cast on our rope drums are made of high-strength ductile iron, and our steel pulleys are high-strength produced from materials.

Our rope drum bodies are; It is also produced from high-strength ductile iron and high-strength special alloy hardened aluminum.

Special materials that have been tested such as tensile and impact are used in gear groups.

Hydraulic Equipments

Hydromotors which are high-torque, high-strength provide the required torque values are used on the products in accordance with the product load capacity.

There are hydraulic valves that enable the opening of the standard hydraulic brake system used in all our products. Hydraulic valve selection is made specific to the products and the project. A special production brake valve suitable for double speed levels is used in products with double speed stage. Special production valve selections such as project-special pressure relief valves are made.

Bearing and Bedding

By making calculations on the products in accordance with the product load capacity, the bedding elements are selected according to the loads on the bearing points on the products.

Sealing Elements

Hydraulic and pneumatic sealing elements such as o-rings, seals, gaskets, etc. used on the products are selected long-lasting products in accordance with the working conditions.

COATING APPLICATIONS

& PAINT

Appropriate coating processes are carried out in our products in order to increase resistance against wear and corrosion.

In our mass production, paint application is carried out in accordance with the mixing rates and drying times specified in the relevant paint processes within our company.

Paint process consists of paint stages below;

Surface preparation

Primer

The final coat

In project-based special productions the paint and coating process are either done by the supplier companies or done in our company, according to the requests.

Some of the paint coating applications used in special productions;

Surface tolerant epoxy primer

Topcoat paint with high fire resistance

Impact resistant glass flake paint

Geomet coating

Zinc nickel plating

Dry film coating

Anodized coating

ASSEMBLY

The assembly process begins when the sub-parts, whose production and controls have been completed, arrive on the assembly line.

The assembly process is completed by the assembly personnel according to the procedure of the relevant product.

The assembled products are sent to the test center and static and dynamic load tests are performed for each product in the test unit.
Products that have been tested and successfully completed are shipped to the storage area.

QUALITY CONTROL

In our company, ISO 9001 Quality Management System is taken as a basis in all processes, all of its requirements are fulfilled and continuous improvements are made.

All the products we produce are produced according to the relevant standards (EN 14492-1, SAE, and CE).

Traceability is ensured by recording the production stages in accordance with the quality management system.

Material entry controls, first product controls, intermediate controls, and final controls are carried out and recorded by quality personnel. The equipment used for control is monitored regarding their calibration and verification.

INCOMING QUALITY CONTROL

When the materials ordered by the purchasing unit arrive, they are taken to the raw material waiting section to be checked.

It is recorded by the incoming quality control personnel after the conformity certificate control, visual inspection and dimensional control of the materials are made.

Accepted parts are sent to the raw material department or to the production department if it will start production. Rejected parts are sent to the returns department and the process is started.

PROCESS CONTROL

The first product controls of the sub-parts produced in our company are made and the production is approved. Until the end of the production, the relevant intermediate controls continue to be made by the quality personnel.

100% hardness control is applied to critical parts that are subjected to the cementation process. The controls are controlled by portable or fixed hardness devices.

Coating and paint controls are made by visual inspection and using a thickness gauge device.

FINAL INSPECTION

After the final controls of the products are made at the maximum load capacity in the load test unit and approved, they are sent to the assembly line again.

Serial number, labeling and packaging processes are done during assembly. After these processes are completed, the final controls are made by the quality personnel according to the order number, and the product is made ready for shipment.

AFTER SALES SERVICES

After-sales services of the products delivered by Hammer Winch are also carried out with the devotion shown in the production process.

With its innovative, sustainable and customer-oriented approaches, Hammer Winch cares about establishing long-term relationships in the sector and aims highest customer satisfaction within the framework of responsible marketing principles.

Within the framework of responsible marketing principles, it is the common motivation of each of our employees to establish long-term relationships in the sector and to satisfy our customers by providing after-sales solution-oriented, fast and reliable services.

Hammer Winch proves its quality with its production and quality certificates in international standards, and also offers after-sales services and spare parts availability guarantee.

Since
2003

LIGHT SERIES

HAMMER **WINCH**

Specifications

Max. pulling capacity (kg / lbs) : 3550 kg (7824 lbs)
Max. Rope length (m/ ft) : 53.8 m (176.4 ft)
Max. rope length for EN (m / ft) : 40.6 m (133 ft)
Recommended wire rope (mm / in) : 10 mm (3/8") 1960 Mpa
Hydromotor (cc / in3) : 250 cc (15 in³)
Max. pump flow (L / min - g / min) : 60 L/min (15.8 g/min)
Gear ratio : 5,6 : 1
Oil types and capactiy : 85W 90 - 0,75 L
Max. working pressure (bar / psi) : 125 bar (1812 psi)

Warning!

- Before operating the winch, A-B lines must be to T line (tank line) of the control valve in center position.
- This winch is designed and manufactured for pulling, don't lift person or material.
- Always keep last 5 wrap on the drum.
- The technical details given above are just for information.
- HAMMER WINCH keeps the right to change the technical details.
- Pneumatic working pressure: Min 9 bar - Max 12 bar (Min 130 psi - Max 174 psi)
- Do not pull a load in fast rope winding mode as the brake system is not activated!

Manual Clutch Shifter
Activating or deactivating the high speed winding / unwinding mode manually

Air Clutch Shifter
Activating or deactivating the high speed winding / unwinding mode pneumatically

Specifications

- Max. pulling capacity (kg / lbs) : 50000 kg (110200 lbs)
- Max. Rope length (m/ ft) : 75 m (246 ft)
- Max. Rope length (SAE) (m/ ft) : 59,5 m (195,3 ft)
- Recommended wire rope (mm / in) : 28 mm (10/9") 2160 Mpa
- Hydromotor (cc / in³) : 160 cc (9.6 in³)
- Max. pump flow (L / min - g / min) : 75 L/min (19.8 g/min)
- Gear ratio : 158 : 1
- Oil types and capacity : 85W 140 - 16 L
- Max. working pressure (bar / psi) : 210 bar (3045 psi)

- Winch: (kg / lbs) 755,8 kg (1665,8 lbs)
- Roller Fairlead: (kg / lbs) 50 kg (110,2 lbs)
- Cable Tensioner: (kg / lbs) 12 kg (26,4 lbs)
- Mounting Bolts 20 pieces M22 8,8
- Hydraulic Inlets G 1/2"
- Standards Cable Tensioner Roller Fairlead Operator Protection Cage Control Valve and Hydraulic Hoses
- Optional Air Clutch IP67 - IP68

- Extra reinforced steel cast body
- Lightweight and strong design
- 100% holding negative-acting hydraulic brake system
- Standard pressure roller and roller fairlead
- Easy assembly, high rope capacity and high torque hydromotor
- Standard manual rope unloading system
- CE Machinery Directive 2006/42/EC
- Meets SAE J706 rating
